Installation of a Sencha Touch Theme

Congratulations to your new Mobile HTML5 Theme. In order to install your Sencha Touch Theme you need to use the suggested Sencha SDK Tools. You can download it here: http://www.sencha.com/products/sdk-tools/

Choose a content section below depending on which package type you bought:

I bought the CSS package

1. Put the app.css file into your applications /resources/css/ folder.
2. Be sure the css file is referenced in the applications configuration file (app.json)
3. Build your project with "sencha app build -e [environment]"

I bought the SCSS package

1. Install Compass (get it from here: http://compass-style.org/install/)
2. Adapt the variables in the SCSS file for your needs
3. Put the app.scss in your applications /resources/scss/ folder
4. Compile the scss file with "compass compile"
5. Optionally: You could use "compass watch" to recompile the scss automatically everytime you changed it
6. Now there should be an app.css be generated to your /resources/css/ folder
7. Finally build your project with "sencha app build -e [environment]"

Enjoy your customized theme :-)

How can I take look at the example app?

1. Copy the example-app folder to your webserver
2. Open the index.html in your webbrowser (it has to be served from the webserver)

Contact

If you need further help with the installation please don't hesitate to contact use per email support@mobile-themes.at, twitter @MobileThemes_AT or via our contact form.
